## WINTER – 2019 EXAMINATION MODEL ANSWER

**Subject: Advanced Computer Network** 

**Subject Code:** 

22520

#### **Important Instructions to examiners:**

- 1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more Importance (Not applicable for subject English and Communication Skills).
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.
- 7) For programming language papers, credit may be given to any other program based on equivalent concept.

## WINTER – 2019 EXAMINATION MODEL ANSWER

**Subject: Advanced Computer Network** 

**Subject Code:** 

22520

**4M** 

Explana tion 2M

## (b) Ans.

## Explain ICMP protocol. Describe the header format of ICMP.

The Internet Control Message Protocol (ICMP) supports the unreliable and connectionless Internet Protocol (IP).

- ICMP messages are encapsulated in IP datagrams. There are two categories of ICMP messages: error-reporting and query messages. The error-reporting messages report problems that a router or a host (destination) may encounter when it processes an IP packet. The query messages, which occur in pairs, help a host or a network manager get specific information from a router or another host.
- The checksum for ICMP is calculated using both the header and the data fields of the ICMP message.
- There are several tools that can be used in the Internet for debugging. We can find if a host or router is alive and running. Two of these tools are ping and traceroute.

#### **Header Format:**

8 bits 8 bits 8 bits 8 bits

Type Code Checksum

Rest of the header

Data section

Format 1M

An ICMP message has an 8-byte header and a variable-size data section. Although the general format of the header is different for each message type, the first 4 bytes are common to all. As Figure shows,

- The first field, ICMP type, defines the **type** of the message.
- The **code field** specifies the reason for the particular message type.

• The last common field is the **checksum field** for checking errors

- The rest of the header is specific for each message type.
- The data section in error messages carries information for finding the original packet that had the error. In query messages, the data section carries extra information based on the type of the query.

## WINTER – 2019 EXAMINATION MODEL ANSWER

**Subject: Advanced Computer Network** 

**Subject Code:** 

22520

#### Explain different transition method of IPv4 to IPv6. **(b)** Ans.

Three Transition from IPv4 to IPv6 strategies are

- 1. Dual Stack
- 2. Tunnelling
- 3. Header Translation

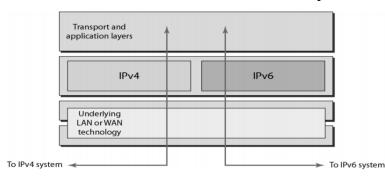

List 1M

**4M** 

#### 1. DUAL STACK

In this kind of strategy a station has a dual stack of protocols run IPv4 and IPv6 simultaneously.

To determine which version to use when sending a packet to a destination, the source host queries the DNS. If the DNS returns an IPv4 address, the source host sends an IPv4 packet. If the DNS returns an IPv6 address, the source host sends an IPv6 packet.

1M for each transitio method

Fig. Dual Stack

#### 2. Tunnelling

Tunnelling is a strategy used when two computers using IPv6 want to communicate with each other and the packet must pass through a region that uses IPv4.

- To pass through this region, the packet must have an IPv4 address. So the IPv6 packet is encapsulated in an IPv4 packet when it enters the region.
- To make it clear that the IPv4 packet is carrying an IPv6 packet as data the protocol value is set to 41.

Subj	icci. Auva	anced Computer Network Subject Code	
	Ans.	The UDP header has four parts, each of two bytes. That means we get the following interpretation of the header.  i) Source port number = $BC82_{16} = 48258$ ii) Destination port number = $000D_{16} = 13$ iii) Total length = $002B_{16} = 43$ bytes  iv) Since the header is 8 bytes the data length is $43 - 8 = 35$ bytes.	Each correct answer carries 1M
4.		Attempt any THREE of the following:	12
	(a)	Construct a diagram to show the application of cookies in a scenario in which the server uses cookies for advertisement.  (Note: Any other diagram shall be considered)	4M
	Ans.	Use of Cookies for advertisements:  A cookie is also used by advertising agencies. An advertising agency can place banner ads on some main website that is often visited by users. The advertising agency supplies only a URL that gives the banner address instead of the banner itself. When a user visits the main website and clicks on the icon of an advertised corporation, a request is sent to the advertising agency.  The advertising agency sends the banner, a GIF file, for example, but it also includes a cookie with the ill of the user.  Any future use of the banners adds to the database that profiles the Web behaviour of the user. The advertising agency has compiled the interests of the user and can sell this information to other parties. This use of cookies has made them very controversial. Hopefully, some new regulations will be devised to preserve the privacy of users.  The user's web browser requests a page from Web Site A returns a page containing objects (ads) located on Web Server X.  Web Site A returns a page from Web Server X and includes the "Referer" header to indicate which page at Web Site A has asked to display the advertisement.  The (third-party) Web Server X returns the requested object(s) and includes its own third-party cookie which the user's web browser retains. Web Server X Database Used to membrate a page its own third-party cookie which the user's web browser retains. Web Server X Database Used to membrate a page its own third-party cookie which the user's web browser retains. ## WINTER – 2019 EXAMINATION MODEL ANSWER

	1		
		TELNET	
		• TELNET is an abbreviation for TErminaLNETwork. It is the	
		standard TCP/IP protocol for virtual terminal service	
		• TELNET enables the establishment of a connection to a remote	
		system in such a way that the local terminal appears to be a	
		terminal at the remote system.	
		There are two parties involved TELNET Client and TELNET	
		server.	
		DNS	
		• It stands for Domain Name Service. Every time you use a domain	
		name, therefore, a DNS service must translate the name into the	
		corresponding IP address.	
		• For example, the domain name www.abc.com might translate to	
		198.105.232.4.	
		• Port number for DNS is 53.	
		Totalisation for Disco.	
		DHCP	
		• It stands for Dynamic Host Configuration Protocol (DHCP). It	
		gives IP addresses to hosts.	
		There is a lot of information a DHCP server can provide to a host	
		when the host is registering for an IP address with the DHCP	
		server.	
		• Port number for DHCP is 67, 68.	
		Totalisation for biter is or, oo.	
		POP3	
		• Post Office Protocol, version 3 (POP3) is simple and limited in	
		functionality.	
		POP works as a Message Access Agent.	
		• The client POP3 software is installed on the recipient computer;	
		the server POP3 software is installed on the mail server.	
		Mail access starts with the client when the user needs to	
		download e-mail from the mailbox on the mail server.

## WINTER – 2019 EXAMINATION MODEL ANSWER

**Subject: Advanced Computer Network** 

**Subject Code:** 

22520

#### **Connection Establishment**

TCP uses a Three way handshaking mechanism to establish a connection between client and server machines.

The three steps in three way handshaking mechanism are as follows.

#### SYN

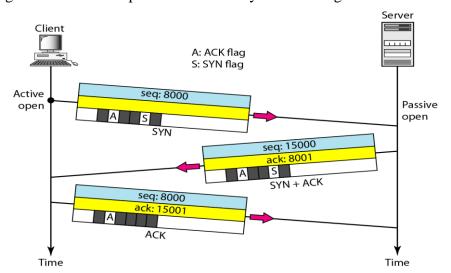

The client sends the first segment, a SYN segment, in which only the SYN flag is set. This segment is for synchronization of sequence numbers.

#### SYN + ACK

The server sends the second segment, a SYN +ACK segment, with 2 flag bits set.

## **ACK**

The client sends the third segment. This is just an ACK segment. It guarantees the completion of three way handshaking.

# If 2 host Simultaneously try to establish connection: Simultaneous Open:

- It's possible for two applications to send a SYN to each other to start a TCP connection, although the possibility is small, because both sides have to know which port on the other side to send to. This process is called "Simultaneous Open", or "simultaneous active open on both sides".
- In a simultaneous open, both applications issue active opens.
- This is a rare situation in which there is no client or server;

1M Diagra m

## WINTER – 2019 EXAMINATION MODEL ANSWER

**Subject: Advanced Computer Network** 

**Subject Code:** 

22520

To keep track of all the different events happening during connection establishment, connection termination, and data transfer, TCP is specified as the **Finite State Machine –FSM** 

#### **TCP State Machine:**

- TCP uses a three way handshake to close connection
- Singled by the FIN bit in the packet header

The figure shows the two FSMs used by the TCP client and server combined in one diagram.

- Ovals/rectangle represents states.
- Transition from one state to another is shown using directed lines.
- Each line has two strings separated by a slash.
- The first string is the input, what TCP receives.
- The second is the output, what TCP sends.
- The dotted black lines in the figure represent the transition that a server normally goes through;
- The solid black lines show the transitions that a client normally goes through.
- Sometimes in some situations, a server transitions through a solid line or a client transitions through a dotted line.

State	Description		
CLOSED	No connection exists

6.		Attempt any TWO of the following:	12					
	(a)	Explain the 3 intra domain routing protocols.	<b>6M</b>					
		(Note: Explanation of any other protocols shall be considered).						
	Ans.	i) Distance Vector Routing:						
		- Require only local state (less overhead smaller footprint)						
		- Harder to debug						
		- Can suffer from loops						
		Distance vector Routing Protocol:						
		Here Distance vector:						
		✓ Current best known cost to reach a destination	Any 3 protoc					
		✓ Idea: exchange vectors among neighbors to learn about						
		lowest cost paths.						
		✓ <b>Distance vector protocols</b> advertise their routing table to all						
		directly connected neighbors at regular frequent intervals	each					
		using a lot of bandwidth and are slow to converge.						
		✓ When a route becomes unavailable, all router tables must be						
		updated with that new information.						
		✓ The problem is with each router having to advertise that new						
		information to its neighbors, it takes a long time for all						
		routers to have a current accurate view of the network.						
		✓ Distance vector protocols use fixed length subnet masks						
		which aren't scalable.						
		- periodically (on the order of several seconds to minutes)						
		- whenever table changes (called triggered update)						
		• Each update is a list of pairs:						
		- (Destination, Cost)						
		• Update local table if receive a "better" route						
		- smaller cost						
		- from newly connected/available neighbor

## WINTER – 2019 EXAMINATION MODEL ANSWER

Subject: Advanced Computer Network Subject Code: 22520

• Refresh existing routes; delete if they time out i.e. RIP-Routing Information Protocol

## ii) Link State Routing:

- Have a global view of the network
- Simpler to debug
- Require global state

#### **Link State Strategy**

- each router shares the information/knowledge of its neighborhood with every other router in the internetwork.
- Send to all nodes (not just neighbors)
- Send only information about directly connected links not entire routing table)

#### Link State Packet (LSP)

- ID of the node that created the LSP
- Cost of link to each directly connected neighbor
- Sequence number (SEQNO)

Time-to-live (TTL) for this packet

#### i.e. OSPF-Open Shortest Path First

## iii) RIPv2:

- \_ Runs over UDP port 520
- \_ Limits networks to 15 hops (16 = 1)
- Depends on count to infinity for loops
- \_ Supports split horizon, poison reverse
- RFC 1812 specifies what options routers should or must have.

#### iv) MOSPF (Multicast Open Shortest Path First):

- This protocol is an extension of the OSPF protocol that uses multicast link state routing to create source-based trees.
- The protocol requires a new link state update packet to associate the unicast address of a host with the group address or addresses the host is sponsoring. This packet is called the group membership LSA. In this way, we can include in the tree only the hosts (using their unicast addresses) that belong to a particular group.
- Thus a tree that contains all the hosts belonging to a group, but we use the unicast address of the host in the calculation.
- For efficiency, the router calculates the shortest path trees on

## WINTER – 2019 EXAMINATION MODEL ANSWER

Subject: Advanced Computer Network

**Subject Code:** 

22520

demand (when it receives the first multicast packet).

- In addition, the tree can be saved in cache memory for future use by the same source/group pair.
- MOSPF is a **data-driven** protocol; the first time an MOSPF router sees a datagram with a given source and group address, the router constructs the Dijkstra shortest path tree.

## v) Multicast Distance Vector Routing (DVMRP):

The **Distance Vector Multicast Routing Protocol (DVMRP)** is an implementation of

multicast distance vector routing. It is a source-based routing protocol, based on RIP.

- ▶ Unicast distance vector routing is very simple; extending it to support multicast routing is complicated.
- ▶ Multicast routing does not allow a router to send its routing table to its neighbors.
- ▶ The idea is to create a table from scratch using the information from the unicast distance vector tables.
- ▶ Multicast distance vector routing uses source-based trees, but the router never actually makes a routing table.
- ▶ When a router receives a multicast packet, it forwards the packet as though it is consulting a routing table.
- ▶ After its use (after a packet is forwarded) the table is destroyed.
- ▶ To accomplish this, the multicast distance vector algorithm uses a process based on four decision-making strategies.

#### vi) PIM-DM (Protocol Independent Multicast, Dense Mode):

- PIM-DM is used when there is a possibility that each router is involved in multicasting (dense mode).
- In this environment, the use of a protocol that broadcasts the packet is justified because almost all routers are involved in the process.
- PIM-DM is a source-based tree routing protocol that uses RPF and pruning/grafting strategies for multicasting.
- Its operation is like DVMRP; however, unlike DVMRP, it does not depend on a specific unicasting protocol.
- It assumes that the autonomous system is using a unicast protocol and each router has a table that can find the outgoing

interface goes down.

4. It can also occur when two **routers** send updates to each other at the same time.

1M for solutio

OR

For a routing protocol to work properly, if a link is broken (cost becomes infinity), every other router should be aware of it immediately, but in distance vector routing, this takes some time. The problem is referred to as **count to infinity.** It takes several updates before the cost for a broken link is recorded as infinity by all routers.

Count to infinity problem can be solved by following methods:

- 1. Defining Infinity
- 2. Split Horizon
- 3. Split Horizon an Poison Reverse

## **Example:**

#### Link Between A & B is Broken

	A	В	С	D
A	0, -	1, A	2, B	3, C
В	1, B	0, -	2, C	3, D
С	2, B	1, C	0, -	1, C
D	3, B	2, C	1, D	0, -

Imagine a network with a graph as shown above in figure 4.8.

- As you see in this graph, there is only one link between A and the other parts of the network.
- Now imagine that the link between A and B is cut.
- At this time, B corrects its table.
- After a specific amount of time, routers exchange their tables, and so B receives C's routing table.
- Since C doesn't know what has happened to the link between A and B, it says that it has a link to A with the weight of 2 (1 for C to B, and 1 for B to A -- it doesn't know B has no link to A).
- B receives this table and thinks there is a separate link between

## WINTER – 2019 EXAMINATION MODEL ANSWER

Subject: Advanced Computer Network Subject Code: 22520

- Email is often used to spread malware, spam and phishing attacks. Attackers use deceptive messages to entice recipients to part with sensitive information, open attachments or click on hyperlinks that install malware on the victim's device.
- Email encryption involves encrypting, or disguising, the content of email messages to protect potentially sensitive information from being read by anyone other than intended recipients. Email encryption often includes authentication.
- Email allows attackers to use it as a way to cause problems in attempt to profit. Whether through spam campaigns, malware and phishing attacks, sophisticated targeted attacks, or business email compromise (BEC), attackers try to take advantage of the lack of security of email to carry out their actions.
- Since most organizations rely on email to do business, attackers exploit email in an attempt to steal sensitive information.
- Because email is an open format, it can be viewed by anyone who can intercept it. It can be easily read and the contents of an email by intercepting it.
- Email Security Policies can be established by viewing the contents of emails flowing through their email servers. It's important to understand what is in the entire email in order to act appropriately. After these baseline policies are put into effect, an organization can enact various security policies on those emails.
- These email security policies can be as simple as removing all executable content from emails to more in-depth actions, like sending suspicious content to a sandboxing tool for detailed analysis.
- If security incidents are detected by these policies, the organization needs to have actionable intelligence about the scope of the attack.
- Enforce email encryption policies to prevent sensitive email information from falling into the wrong hands.
- An email gateway scans and processes all incoming and outgoing email and makes sure that threats are not allowed in. Because attacks are increasingly sophisticated, standard security measures, such as blocking known bad file attachments, are no longer effective.

Any 6 points 1M each

## WINTER – 2019 EXAMINATION MODEL ANSWER

- Deploy a secure email gateway that uses a multi-layered approach.
- It's also important to deploy an automated email encryption solution as a best practice. This solution should be able to analyze all outbound email traffic to determine whether the material is sensitive.
- If the content is sensitive, it needs to be encrypted before it is emailed to the intended recipient. This will prevent attackers from viewing emails, even if they were to intercept them.
- The Pretty Good Privacy (PGP) provides e-mail with privacy, integrity, and authentication can be used over non secure channel such as internet. It is used for signing, encrypting and decrypting texts, e-mails, files, directories and whole disk partitions and to increase the security of e-mail communications.
- Another security service designed for electronic mail is Secure/Multipurpose Internet Mail Extension (S/MIME). The protocol is an enhancement of the Multipurpose Internet Mail Extension (MIME) protocol. This allows user to digitally sign the email to enhance privacy and data security.
